Germany

POLYTECH

As unique as you are

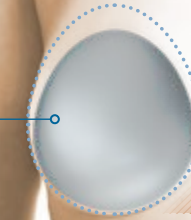

Choosing to have breast augmentation is a major decision and you will have questions.

What implants are right for me?
How will my new breasts look and feel?

With B-Lite® lightweight implants we believe we may have made answering these questions a little easier.

Less weight = Less stress

What are B-Lite® lightweight implants?

B-Lite® is the first true innovation in breast implant technology in over 30 years. A unique combination of clinically proven materials that reduce the weight of a breast implant without reducing the volume or size.

The lightness is possible by using patented technology combining high purity microspheres bonded seamlessly with the latest generation highly cohesive medical grade silicone gel.

The B-Lite® lightweight implants were invented by Dr. Jacky Govrin-Yehudain, having witnessed the effects of gravity on breast tissue in thousands of women.

Benefits of B-Lite®

- **Less weight = less stretch** of the breast tissue over time so less sagging¹
- Patients report **reduced post-operative pain**²
- Patients report a **faster return to normal activities**²
- The implants may provide **greater daily comfort**

Lightness you can feel
